Job Market Paper:

THE MIGRATION CONSEQUENCES OF INPUT SUBSIDIES

Abstract: Rural antipoverty programs often focus on increasing agricultural productivity by transferring resources to farmers. Yet, many farmers' most productive investment may be in another technology: migration. This paper examines in two parts how a Zambian input subsidies (ISPs) affect farmers' farming and migration decisions. First, I use a difference-in-differences strategy exploiting the variations in the roll-out of the ISP. I show that the ISP increases fertilizer adoption but also doubles the rates of individual outmigration. Furthermore, 30% of the variance in total outmigration is consistent with farmers monetizing the subsidy in resale markets. Second, I use a structural model to compare ISPs in the presence of resale markets, to a lump sum cash transfer and an in-kind transfer. When the model accounts for the externality in adoption, I find that ISP with resale markets is superior to a cash transfer, and fosters highest levels of specialization. With resale markets, the ISP is a convex combination of a cash-transfer to resellers and an in-kind transfers to net-buyers.

Other Work in Progress:

ALLOCATION OF LABOR ACROSS GHANA'S HEALTH FACILITIES (with Awoonor-Williams K, Ismaila H, Ofosu A, Williams MJ)

<u>Summary</u>: We use never-used-before administrative data covering all Ghana's healthcare staff and facilities. We measure potential gains from reallocating labor across facilities while accounting for administrative constraints. We provide the first comprehensive estimate of a healthcare system production functions. We further explores the allocation of medical labor across vacancies and geographic areas.

ELICITING HETEROGENEOUS PREFERENCES FOR FAIRNESS (with Panin A, Cisse M)

<u>Summary</u>: We will explore how individuals rank fairness definitions used in the development of artificial intelligence (AI) systems. We design a behavioral experiment to reveal preferences for fair processes (rather than outcomes) embedded in AI systems. We use experimental methods to add to the machine fairness literature, being the first (to our knowledge) to measure preferences for machine fairness definitions by observing choices over definitions when individuals interact with different machine fairness rules. Prior work measured preferences solely with survey instruments.

Published Work:

THE RELATIVELY YOUNG AND RURAL POPULATION MAY LIMIT THE SPREAD AND SEVERITY OF COVID-19 IN AFRICA: A MODELLING STUDY, BMJ Global Health 2020;5:e002699. (with Ngom M, Pougué Biyong C, Pougué Biyong J N.) [paper]

<u>Introduction</u>: A novel coronavirus disease 2019 (COVID-19) has spread to all regions of the world. There is great uncertainty regarding how countries' characteristics will affect the spread of the epidemic; to date, there are few studies that attempt to predict the spread of the epidemic in African countries. In this paper, we investigate the role of demographic patterns, urbanisation and comorbidities on the possible trajectories of COVID-19 in Ghana, Kenya and Senegal.

<u>Methods</u>: We use an augmented deterministic Susceptible-Infected-Recovered model to predict the true spread of the disease, under the containment measures taken so far. We disaggregate the infected compartment into asymptomatic, mildly symptomatic and severely symptomatic to match observed clinical development of COVID-19. We also account for age structures, urbanisation and comorbidities (HIV, tuberculosis, anaemia).

<u>Results</u>: In our baseline model, we project that the peak of active cases will occur in July, subject to the effectiveness of policy measures. When accounting for the urbanisation, and factoring in comorbidities, the peak may occur between 2 June and 17 June (Ghana), 22 July and 29 August

(Kenya) and, finally, 28 May and 15 June (Senegal). Successful containment policies could lead to lower rates of severe infections. While most cases will be mild, we project in the absence of policies further containing the spread, that between 0.78% and 1.03%, 0.61% and 1.22%, and 0.60% and 0.84% of individuals in Ghana, Kenya and Senegal, respectively, may develop severe symptoms at the time of the peak of the epidemic.

<u>Conclusion</u>: Compared with Europe, Africa's younger and rural population may modify the severity of the epidemic. The large youth population may lead to more infections but most of these infections will be asymptomatic or mild, and will probably go undetected. The higher prevalence of underlying conditions must be considered.
